Mark Suckow

**Chapter 010, Basic Experimental Methods in the Rabbit (American College of Laboratory Animal Medicine)** Mark Suckow

NOTE: This is a single chapter excerpted from the book *The Laboratory Rabbit, Guinea Pig, Hamster, and Other Rodents*, made available for individual purchase. Additional chapters, as well as the entire book, may be purchased separately.

This chapter describes humane methods for handling and restraining laboratory rabbits, as well as techniques for obtaining biological samples for administering substances and for specialized procedures. Rabbits have individual temperaments, and a gentle, calm, confident restraint method and demeanor in working with each animal will decrease stress for both the rabbit and the researcher. Rabbits can easily be injured, and can inflict injury on the handler if proper considerations are not followed to keep the animals secure and to minimize stress. Acclimating the animals in advance to procedure areas and restraint methods can be helpful. Whenever possible, use of anesthesia or tranquilizing medication can facilitate procedures. Analgesia is provided after procedures that may cause pain or discomfort after the anesthetic has worn off. Finally, each researcher must be willing to acknowledge when a particular method or procedure does not succeed, and seek assistance or an alternative method.
